GUIDING PRINCIPLES FOR PHYSICIANS RECOMMENDING MOBILE HEALTH APPLICATIONS TO PATIENTS

The document is designed to enable physicians to provide mobile health applications to enhance the management of the patient's health, social, and mental health.

Background
1. Mobile health applications, often referred to as apps, are software applications designed to run on mobile devices. These applications can provide a range of functionalities, including tracking physical activity, managing medication, and monitoring health conditions.
2. The ability to share and exchange data between the mobile device and the physician's office is essential for effective patient care.
3. The compatibility of mobile health applications with other healthcare technologies is crucial for ensuring seamless integration into the patient's care plan.
4. The user interface of mobile health applications should be intuitive and user-friendly to encourage patient adoption.
5. Privacy and security measures should be in place to protect patient data.

Recommendations
1. Physicians should consider the following when recommending mobile health applications to patients:
   - The application's purpose and how it aligns with the patient's needs.
   - The application's ease of use and accessibility.
   - The application's compatibility with other healthcare technologies.
   - The application's privacy and security measures.

2. Physicians are encouraged to:
   - Educate patients on the benefits and limitations of mobile health applications.
   - Monitor the patient's progress and provide guidance as needed.
   - Encourage patients to share their experiences with the application with other healthcare professionals.

3. The use of mobile health applications should be guided by clinical judgment and should not replace traditional methods of patient care.

4. The Canadian Medical Association (CMA) is committed to supporting the development and implementation of mobile health applications in the management of patient health information.
