WHAT IT IS
The purpose of this statement is to increase the awareness and development of a patient-partnered health information governance framework that recognizes the role of health information in the care of patients and in the delivery of health services. The framework should be developed in collaboration with patients and other stakeholders to ensure that it is practical, accessible, and effective in supporting the goals of patient-centered care. The framework should be flexible and adaptable to the needs of different health care systems and should be regularly reviewed and updated to reflect changes in health care practices and technologies.

1. How the patient and their family, at the core of care, can support quality health services for the patient
2. How the patient and their family, in the development of the framework, can be consulted, informed, and engaged through participation, education, and the exchange of information
3. How the patients and their families can contribute to the development and implementation of the framework

To achieve this, a health technology assessment framework should be developed that includes: a) the use of health information in the delivery of health services, and b) the integration of these systems with the overall health information governance framework for health care delivery organizations.
