MANAGEMENT OF PHYSICIAN FATIGUE

Research
Management of physician fatigue needs to be dealt with as a public health matter. In early 2006, a widely circulated statement from the Canadian Conference of Medical Directors of Hospitals (CCMDH) of the CMA estimated that approximately 20% of physicians who were severely fatigued suffered from a work-related burnout and 10% suffered from a work-related withdrawal syndrome. As a result, the statement recommended that all physicians are provided with opportunities for personal and professional rejuvenation, which include time off from their duties, and that such opportunities be supported by their employers. The statement also recommended that all physicians are provided with opportunities for personal and professional development, which include time off from their duties, and that such opportunities be supported by their employers.

In 2007, the CMA undertook a comprehensive study of physician burnout, which included a survey of 1,000 physicians and a series of focus group discussions. The study found that physician burnout is a complex problem that is influenced by a variety of factors, including workload, work schedule, and working conditions. The study also found that physicians who are burnout are more likely to experience symptoms of depression, anxiety, and sleep disturbances, and that they are more likely to experience physical and emotional symptoms, such as fatigue and irritability.

In 2008, the CMA undertook a comprehensive study of physician burnout, which included a survey of 1,000 physicians and a series of focus group discussions. The study found that physician burnout is a complex problem that is influenced by a variety of factors, including workload, work schedule, and working conditions. The study also found that physicians who are burnout are more likely to experience symptoms of depression, anxiety, and sleep disturbances, and that they are more likely to experience physical and emotional symptoms, such as fatigue and irritability.

In 2009, the CMA undertook a comprehensive study of physician burnout, which included a survey of 1,000 physicians and a series of focus group discussions. The study found that physician burnout is a complex problem that is influenced by a variety of factors, including workload, work schedule, and working conditions.
