Guiding principles for the Optimal Use of Data Analytics by Physicians at the Point of Care

**Executive Summary**

Electronic health records are being used more widely in creating their own dataset. A majority of physicians in Canada have implemented electronic health records (EHR) systems, allowing physicians to obtain patient data more efficiently and accurately. However, ensuring that EHR data are provided to physicians in a format that is most useful to them is critical to improving clinical and patient care. The CMA recommends implementing an EHR system that provides access to relevant and timely data at the point of care.

**Policy**

Optimizing the patient care process involves balancing the interests of all parties involved. Physicians and patients are the main stakeholders in the process, and ensuring that their needs are met is crucial. The CMA recommends that EHR systems be designed to support the needs of both physicians and patients, with a focus on improving clinical decision-making and patient outcomes.
