PALLIATIVE CARE

Introduction:
Palliative care is an approach that aims to improve the quality of life for patients and their families facing life-limiting illness. Palliative care is provided in all settings, including hospitals, homes, hospices, and long-term care facilities. It focuses on providing pain and symptom management, emotional support, and overall well-being to improve quality of life.

Guiding principles:
1. All patients, regardless of age, who are facing a life-limiting illness, should have access to palliative care services. This includes patients with chronic diseases, as well as those with cancer, end-of-life care, and terminal illness.
2. The care provided should be compassionate and respectful of the patient's wishes and preferences.
3. The care team should include medical professionals, nurses, social workers, and other support personnel.
4. The interdisciplinary team should provide holistic care, addressing the physical, emotional, and spiritual needs of the patient.
