Health inequities – or avoidable differences in health status between populations – that were exposed and exacerbated during the COVID-19 pandemic can be addressed through interventions and policy changes that were not fully implemented before SARS-CoV-2 spread across Canada. Vulnerable people, workers, people with a low income, people experiencing homelessness, people who are Indigenous and people who are incarcerated were disproportionately affected during the pandemic. The pandemic revealed our interdependence as the spread of the virus among people experiencing disadvantage threatened the health of everyone, including those with privilege, and this has led to calls to address inequities under various such as “the same is possible with everyone” and “we are in this together.”

The recommendations in this guideline that have been provided to Canada may take an SARS-CoV-2 intervention not only and the immediate harms of COVID-19 pandemic. Considered pandemic responses include efforts to reduce the “transmission” after the immediate threat of the COVID-19 pandemic has subsided and the need to address inequities after their removal the collective as a “resilient response, resilient, resilient and resilient” to the multiple harms of the pandemic have been long-term and implemented. We identify an opportunity to recover from a pandemic to ensure a particular health equity as part of longer term pandemic recovery.

Scope

The purpose of these recommendations is to address inequities that were exacerbated by the pandemic, and to inform policies necessary to a health equity perspective by making recommendations in the areas of income, housing, job, and pay for workers, affordable, access to health care, and education. The primary population in a focus experiencing the related inequities

Key points

- Policies that were exposed and exacerbated by COVID-19 should not further threaten health after the pandemic.
- Health, environmental and occupational safety measures, housing, safety from violence, justice, education, access to health care and education are critical to be considered.
- Implementing pandemic recovery and longer term policies, health equity and social justice, during the pandemic recovery and before the next pandemic.
- Qualitative and quantitative data and design or health equity should be carefully reviewed to inform to new strategies, Canadian adaptation.

regardless of their location in Canada (urban, rural or remote) and include new Canadians and migrants. The target audience are decision-makers in the federal, provincial and municipal governments, who set policies related to the regulation, distribution, and health care providers who care for people experiencing disadvantage, especially primary care providers. The target audience may use these recommendations to inform policy and clinical decisions.

The “pandemic recovery point” refers to the time when direct harms of COVID-19 subside, like recommended interventions and changes could be needed for months, years or permanently. Some changes could happen immediately.

The recommendations provide insights into the effectiveness of income and social insurance for those who are affected by unemployment or low income, housing interventions for people experiencing homelessness or vulnerable housing, interventions for people experiencing income and pay issues, interventions to address childhood health equity, interventions to improve access to health care, and steps to address mental health.
