GUIDING PRINCIPLES FOR PHYSICIANS RECOMMENDING MOBILE HEALTH APPLICATIONS TO PATIENTS

This document is designed to provide health information for physicians about how to assess a mobile health application for recommendations to a patient in the management of that patient's health, health care, and health care information.

These guiding principles build on the Canadian Medical Association's (CMA) Physician Guidelines for Online Communication with Patients.¹

Background

- Mobile health applications, distinct from regulated medical devices, may be defined as an application on a mobile device that is intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease. The functions of these applications may include:
 - The ability to store and track information about an individual or group's health or the social determinants thereof;
 - Periodic educational information, reminders, or motivational guidance;
 - GPS location information to direct or alert patients;
 - Downloaded checklists or questionnaires.²
- Mobile health applications can enhance health outcomes while reducing health care costs because of their potential to improve a patient's access to information and care providers.³
- Mobile health applications are most commonly used on a smart phone and/or tablet. Some may also interface with medical devices.
- The use of mobile health applications reflects an emerging trend toward personalized medicine and patient involvement in the management of their health information. By 2016, 142 million
